A Novel *In Vitro* Cell Culture Model for Juvenile Idiopathic Arthritis

Background

- Juvenile idiopathic arthritis (JIA) is the most common rheumatic disease in children, affecting around 1 in 1,000 and posing a risk of lifelong disability.
- Gaps in understanding disease mechanisms have hindered development of targeted therapies.

Figure 1: Bony overgrowth seen in child affected by JIA. From About Juvenile Idiopathic Arthritis [Image], n.d., American College of Rheumatology: Rheumatology for Primary Care (https://rheumforprimarycare.org/jia/)

- **Fibroblast-like synoviocytes (FLS),** found within the joint synovium, are cells that drive JIA disease progression (Figure 2).
- JIA FLS adopt inflammatory and proliferative states and have a **unique chondrocyte-like characteristic**. Chondrocytes are also known to contribute to bone formation.

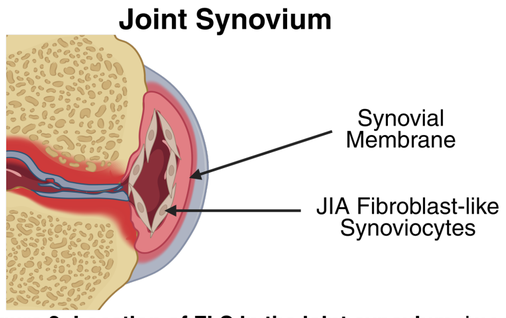

Figure 2: Location of FLS in the joint synovium. Image adapted from BioRender template and edited by Finalist, 2025.

Problem: The study of JIA lacks an *in vitro* cell culture model (lab model) and relies mainly on primary cells, limiting investigation of disease.

- The **growth factor BMP4** has been found to drive cell types other than FLS toward displaying a chondrocyte-like phenotype, making it a strong candidate for inducing JIA FLS–like properties.
- Rheumatoid arthritis (RA) is frequently used as a reference for JIA
  - RA FLS studies are supported by the use of a well-characterized *in vitro* cell culture model, the synovial sarcoma cell line **SW982.**

Research Questions: Can BMP4-treated SW982 cells serve as an *in vitro* model of JIA FLS? Does BMP4 treatment induce proliferation, inflammation, and a chondrocyte-like phenotype comparable JIA FLS? (Figure 3)

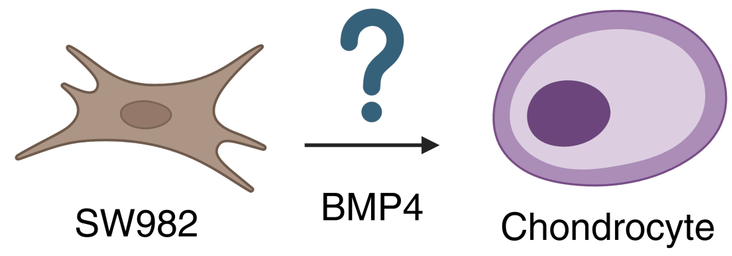

Figure 3: Whether BMP4-treated SW982 cells can model the chondrocyte-like behavior of JIA FLS remains to be elucidated. Image created by Finalist using BioRender, 2025.

Methods

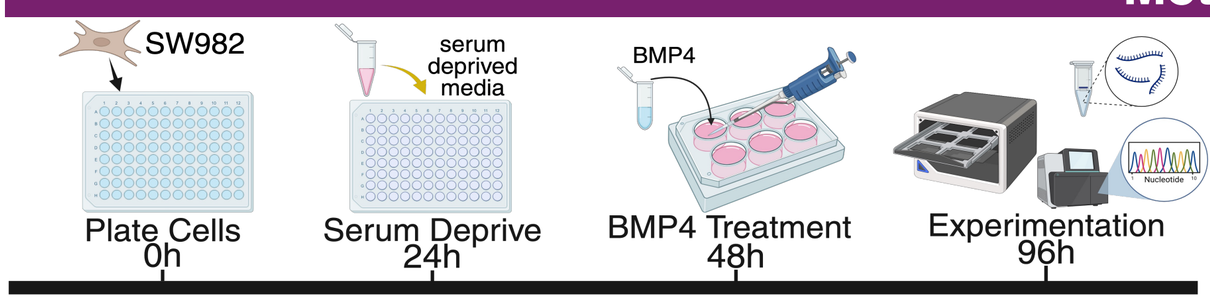

Figure 4: Experimental timeline with serum deprivation (0.2% FBS) after 48 hours of treatment. Image created by Finalist in BioRender, 2026.

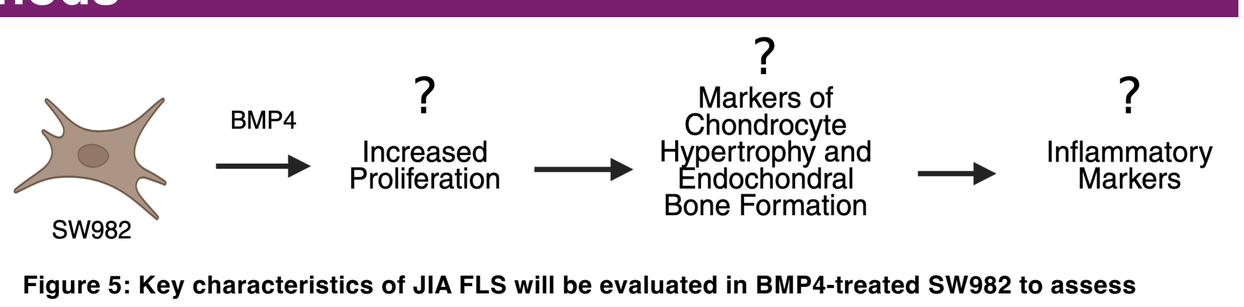

Figure 5: Key characteristics of JIA FLS will be evaluated in BMP4-treated SW982 to assess suitability as an *in vitro* model. Three characteristics will be analyzed: proliferation, chondrocyte-like phenotype, and inflammatory markers. Image created by Finalist in BioRender, 2025.

Creating The Novel Model: Model Exhibits JIA FLS Proliferative Phenotype

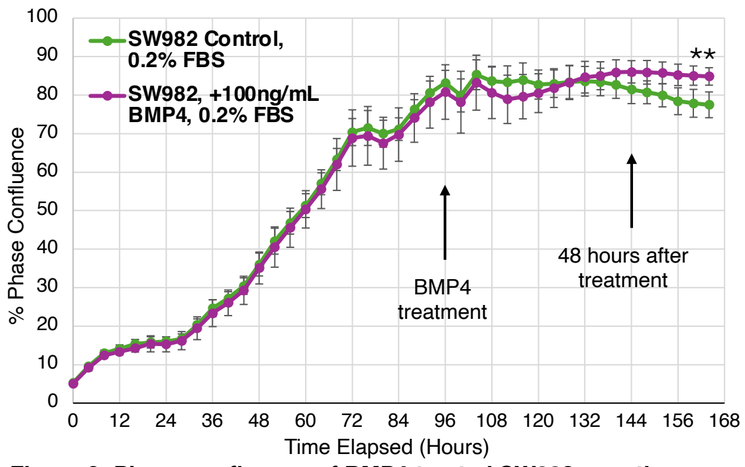

Figure 6: Phase confluence of BMP4-treated SW982 over time, showing proliferative phenotype of model. (* = p<0.05) (n=3). Image created by Finalist in Excel, 2025.

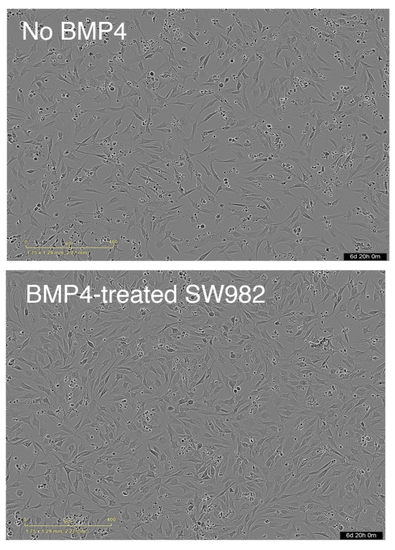

Figure 7: Effect of BMP4 on SW982 proliferation. Evidence of cell proliferation after 48 hours of treatment of 100 ng/mL BMP4 in 0.2% FBS compared to vehicle control. Taken on IncuCyte S3 at 10x. Images taken by Finalist and formatting in BioRender, 2025.

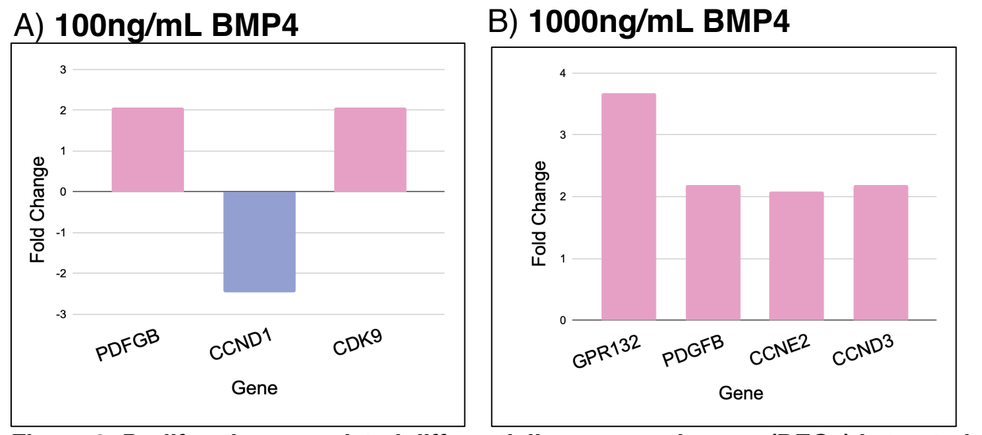

Figure 8: Proliferation associated differentially expressed genes (DEGs) in treated SW982 (48h). A) DEGs in model (100ng/mL BMP4). **B)** DEGs in model (1000ng/mL BMP4) (IFCI>2). Blue indicates downregulated genes. Pink indicates upregulated genes. Image created in Google Sheets by Finalist, 2025.

Model Exhibits JIA FLS Chondrocyte-like Phenotype

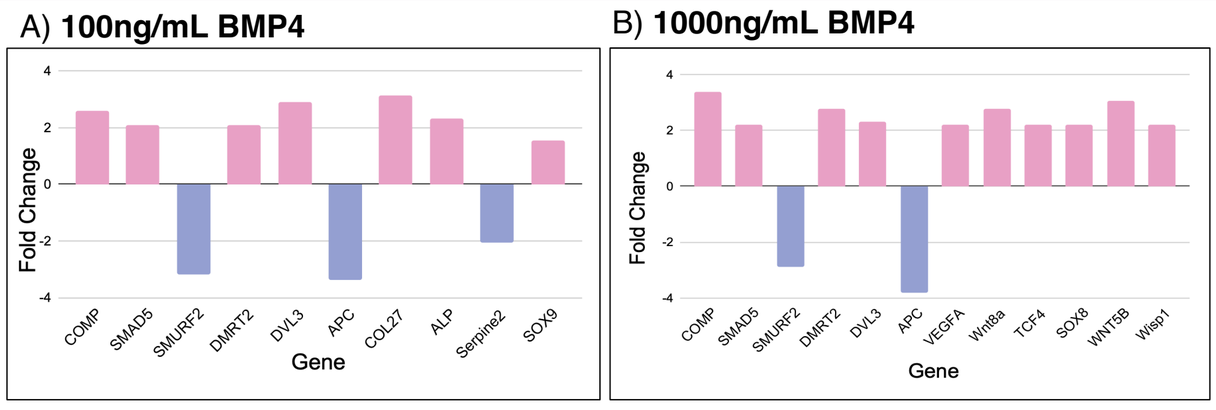

Figure 9: Chondrocyte associated DEGs in BMP4 treated SW982 (48h). A) DEGs in model (100ng/mL BMP4). **B)** DEGs in model (1000ng/mL BMP4) (IFCI>1.5). Blue indicates downregulated genes. Pink indicates upregulated genes. Image created in Google Sheets by Finalist, 2025.

Model Exhibits JIA FLS Inflammatory Phenotype

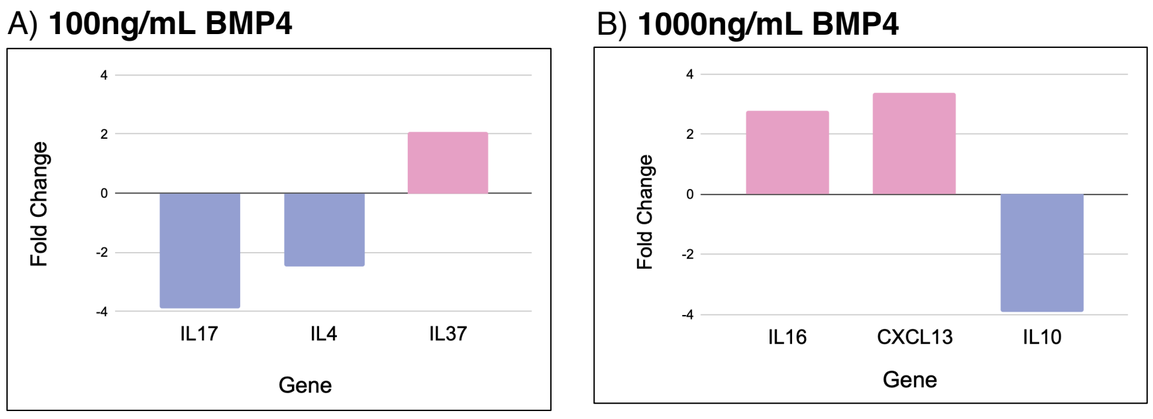

Figure 10: Inflammation associated DEGs in BMP4 treated SW982 (48h). A) DEGs in model (100ng/mL BMP4). **B)** DEGs in model (1000ng/mL BMP4) (IFCI>2). Blue indicates downregulated genes. Pink indicates upregulated genes. Image created in Google Sheets by Finalist, 2025.

Conclusions/Applications

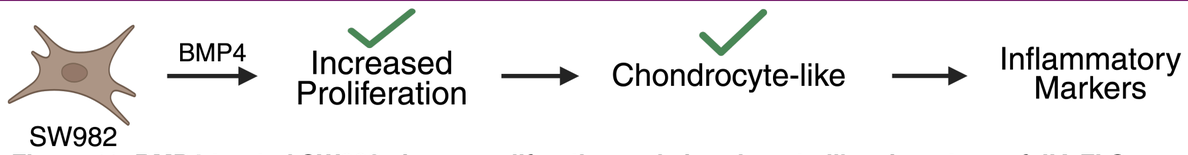

Figure 11: BMP4-treated SW982 shows proliferative and chondrocyte-like phenotype of JIA FLS, suggesting a novel *in vitro* model for JIA FLS. Image created in BioRender by Finalist, 2026.

Findings: For the first time, This study suggests a BMP4-treated SW982 *in vitro* JIA FLS model, moving research towards improved therapies for children.

- Model shows characteristics of JIA FLS proliferative and chondrocyte-like phenotype.
- Study proposed the canonical BMP4 and Wnt pathway are involved in JIA disease progression.
  - Reveals novel pathways to explore for treatment
  - Noggin and chordin, BMP4 inhibitors, can be investigated as potential treatments

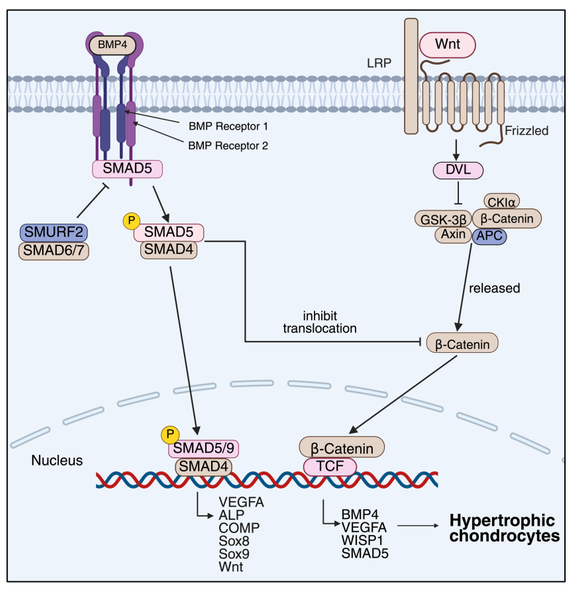

Figure 12: Model shows similar gene profile to BMP4 and Wnt pathway. Image made in BioRender by Finalist, 2026.

Future Works

- Noggin and chordin, inhibitors of BMP4, will be used to verify that observed changes in SW982 are driven by BMP4 signaling.
- Effects of methotrexate (MTX), a first line treatment for JIA, on model will be explored.
- In JIA FLS, MTX has been shown to inhibit the chondrocyte-like phenotype (Simonds et al., 2024).

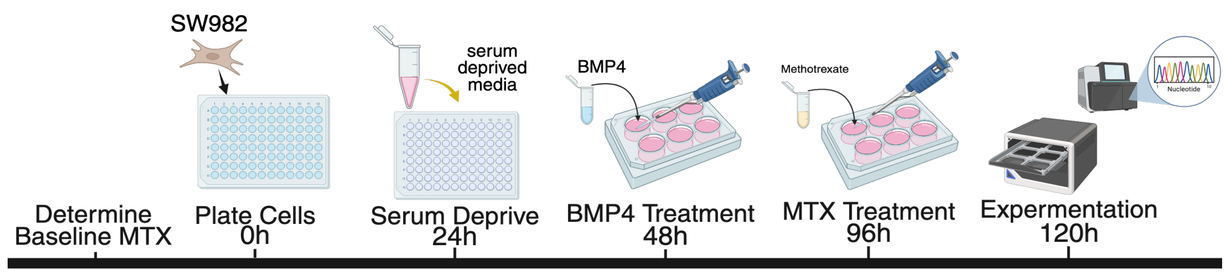

Figure 13: Treatment of novel model with methotrexate to determine JIA FLS–like responses and investigate mechanisms of disease pathogenesis. Image created in BioRender by Finalist, 2026.
